IMovie – Ideation Phase

Date: 25 October 2026 · **Team ID:** [add team ID] · **Project Name:** IMovie – Movie Ticket Booking Application

1. Define the Problem Statement

Booking a movie ticket usually means standing in a queue at the cinema counter, or using a large platform where smaller theatres have no simple way to publish their shows, seat tiers and prices. Moviegoers lose time, and theatre owners lose customers who do not want to wait or travel just to check availability.

The problem statements below are based on this analysis and on the two user types the application serves.

Problem Statement	I am	I am trying to	But	Because	Which makes me feel
PS-1	A moviegoer	Book tickets for a show of my choice quickly	I cannot easily see which shows and seats are available and often have to go to the counter	Show and seat information is scattered or only available on site	Frustrated and short of time
PS-2	A theatre manager	List my theatre, seating tiers and show timings online	I have no simple tool to publish shows and track bookings	Setting up online booking is manual or depends on bigger platforms	Overwhelmed and worried about losing customers

Problem statement: Moviegoers need a fast way to find a show, pick seats, pay and get a confirmation without queuing, and theatre admins need a simple dashboard to add theatres, shows and see bookings.

2. Empathy Map

User 1: Moviegoer (assumed persona, a college student or working professional)

Says	Thinks	Does	Feels
I want to watch this movie this weekend	Will seats be available? Is the price fair?	Checks movie lists, asks friends, visits the counter	Impatient when queues are long, anxious about sold-out shows
Just show me the seats and let me pay	I should not have to call the theatre	Compares showtimes and prices	Happy when booking takes a few clicks

User 2: Theatre admin (assumed persona)

Says	Thinks	Does	Feels
I need to put my shows online	Setting up seat layouts and prices should be easy	Maintains schedules manually	Stressed about empty seats and manual work
I want to see who booked what	I need a clear view of bookings	Counts tickets at the counter	Relieved when everything is in one dashboard

3. Brainstorming

Ideas collected during brainstorming:

- Browse popular and upcoming movies (posters, release date)
- Search by movie, theatre or location
- Theatre management with three seat tiers (balcony, middle, lower) and tier-wise prices
- Show scheduling by movie, date and time
- Interactive seat map with booked seats marked
- User registration and login, plus Google sign-in
- Online payment
- Booking confirmation email
- My Bookings page and ticket cancellation
- QR code ticket

- Admin dashboard with bookings view
- Reviews and ratings, offers and coupons, notifications

4. Idea Prioritization

Priority	Idea	Reason	Status
Must have	Movie browsing	Core entry point	Done (TMDB)
Must have	Theatre and show management	Without shows there is nothing to book	Theatre done, shows in progress
Must have	User registration and login	Needed to attach bookings to users	Planned
Must have	Seat selection and booking	Core value of the product	Planned
Must have	Online payment	Confirms the booking	Planned
Must have	Booking confirmation email	Proof of booking for the user	Planned
Should have	Google OAuth login	Faster sign-up	Planned
Should have	Search and genre filter	Easier discovery	Planned
Should have	My Bookings and cancellation	Basic user control	Planned
Could have	QR ticket, reviews, offers, analytics	Nice additions after the main flow works	Future

5. Selected Idea

IMovie is a MERN-stack web application that connects moviegoers and theatre admins. Users browse movies, choose a show, select seats, pay online and receive a confirmation email. Admins register theatres with seat tiers and prices, schedule shows and view

bookings.

Expected outcome: a single flow from discovering a movie to receiving a booking confirmation, with no queue and no manual coordination.
